# About

This is a *sample* book written in **Markdown**. Y

# Chapter 1

## (PART\*) Basics R

## Chapter 2

# What is R?

R is a free and open source statistical programming language that facilitates statistical computation. There are a myriad of application that can be done in R, thanks to a huge online support community and dedicated packages. However, R has no graphical user interface and it has to be run by typing commands into a text interface.

### 2.1 What is RStudio?

RStudio provides graphical interface to R! You can think of RStudio as a graphical front-end to R that provides extra functionality. The use of the R programming language with the RStudio interface is an essential component of this course.

### 2.2 R Studio Server

The quickest way to get started is to go to <https://maize.mathcs.carleton.edu>, which opens an R Studio window in your web browser. Once logged in, I recommend that you do the following:

- Step 1: Create a folder for this course where you can save all of your work. In the Files window, click on New Folder.
- Step 2: Click on Tools -> Global Options -> R Markdown. Then uncheck the box that says “Show output inline...”

(It is also possible to download RStudio on your own laptop. Instructions may be found at the end of this document.)

## 2.3 R Markdown Basics

An R Markdown file (.Rmd file) combines R commands and written analyses, which are ‘knit’ together into an HTML, PDF, or Microsoft Word document.

An R Markdown file contains three essential elements:

- Header: The header (top) of the file contains information like the document title, author, date and your preferred output format (pdf\_document, word\_document, or html\_document).
- Written analysis: You write up your analysis after the header and embed R code where needed. The online help below shows ways to add formatting details like bold words, lists, section labels, etc to your final pdf/word/html document. For example, adding **\*\*** before and after a word will bold that word in your compiled document.
- R chunks: R chunks contain the R commands that you want evaluated. You embed these chunks within your written analysis and they are evaluated when you compile the document.

### 2.3.1 R Markdown example:

- Simple R Markdown example
  - compiled pdf

The following handouts, written by Prof Katie St Clair, contain useful information for making the figures and tables in your compiled documents look nice:

- Graph Formatting: Markdown .Rmd file and pdf
- Table Formatting: Markdown .Rmd file and pdf

## 2.4 Installing R/RStudio (not needed if you are using the maize server)

- Download the latest version of R:
  - Windows: <http://cran.r-project.org/bin/windows/base/>
  - Mac: <http://cran.r-project.org/bin/macosx/>
- Download the free Rstudio desktop version (Windows or Mac): <https://www.rstudio.com/products/rstudio/download/>

Use the default download and install options for each.

## 2.5 Install LaTeX (for knitting R Markdown documents to PDF):

If you want to compile R Markdown to .pdf files, you also need a LaTeX distribution (Note: this is not necessary if you choose to compile as a Word document.) Click instructions for Windows or instructions for Mac, depending on your operating system to complete the installation.

## 2.6 Updating R/RStudio (not needed if you are using the maize server)

If you have used a local version of R/RStudio before and it is still installed on your machine, then you should make sure that you have the most recent versions of each program.

- To check your version of R, run the command `getRversion()` and compare your version to the newest version posted on <https://cran.r-project.org/>. If you need an update, then install the newer version using the installation directions above.
- In RStudio, check for updates with the menu option **Help > Check for updates**. Follow directions if an update is needed.

## Chapter 3

# R Markdown

This is a R Markdown document. Markdown is a simple formatting syntax for authoring HTML, PDF, and MS Word documents. For more details on using R Markdown see <http://rmarkdown.rstudio.com>.

You can use asterisk mark to provide emphasis, such as ***italics*** or **bold**.

You can create lists with a dash:

```
- Item 1
- Item 2
- Item 3
  + Subitem 1
* Item 4
```

- Item 1
- Item 2
- Item 3
  - Subitem 1
- Item 4

You can embed Latex equations in-line,  $\frac{1}{n} \sum_{i=1}^n x_i$  or in a new line as

$$\text{Var}(X) = \frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2$$

## Embed an R code chunk:

Use

```
```r
Use back ticks to
create a block of code
```
```

to produce:

```
Use back ticks to
create a block of code
```

You can also evaluate and display the results of R code. Each task can be accomplished in a suitably labeled chunk like the following:

```
summary(cars)
```

| speed        | dist           |
|--------------|----------------|
| Min. : 4.0   | Min. : 2.00    |
| 1st Qu.:12.0 | 1st Qu.: 26.00 |
| Median :15.0 | Median : 36.00 |
| Mean :15.4   | Mean : 42.98   |
| 3rd Qu.:19.0 | 3rd Qu.: 56.00 |
| Max. :25.0   | Max. :120.00   |

```
fit <- lm(dist ~ speed, data = cars)
fit
```

Call:

```
lm(formula = dist ~ speed, data = cars)
```

Coefficients:

|             |       |
|-------------|-------|
| (Intercept) | speed |
| -17.579     | 3.932 |

## 3.1 Including Plots

You can also embed plots. See Figure 3.1 for example:

```
par(mar = c(0, 1, 0, 1))
pie(
  c(280, 60, 20),
  c('Sky', 'Sunny side of pyramid', 'Shady side of pyramid'),
```

```
col = c('#0292D8', '#F7EA39', '#C4B632'),  
init.angle = -50, border = NA  
)
```

Figure 3.1: A fancy pie chart.

## 3.2 Read in data files

```
simple_data <- read.csv("https://deepbas.io/data/simple-1.dat", )  
summary(simple_data)
```

```

      initials      state      age
Length:3      Length:3      Min.   :45.0
Class :character Class :character 1st Qu.:47.5
Mode  :character Mode  :character Median :50.0
                                      Mean  :52.0
                                      3rd Qu.:55.5
                                      Max.   :61.0

      time
Length:3
Class :character
Mode  :character

```

```
knitr::kable(simple_data, format = "html")
```

```
initials
```

```
state
```

```
age
```

```
time
```

```
vib
```

```
MA
```

```

```

```
5:45
```

```
kme
```

```
CT
```

```
50
```

```
4:19
```

### 3.3 Hide the code

If we enter the `echo = FALSE` option in the R chunk (see the .Rmd file). This prevents the R code from being printed to your document; you just see the results.

initials

## Chapter 4

### (PART\*) Class Activity

## Chapter 5

## Conclusion

Click for answer

The correct answer is a. If there is a difference, we expect the between group variability to be higher than within group variability. RIGHT TAIL test!

```
Temperature = 37.7 + 0.231 Chirps
Predictor    Coef    SE Coef    T    Pr(>|t|)
Constant    37.67858    1.97817    19.05 7.35e-06 ***
Chirps       0.23067     0.01423    16.21 1.63e-05 ***
```

```
survey <- read.csv("https://raw.githubusercontent.com/deepbas/statdatasets/main/StudentSurvey.csv")
mean(survey$Pulse) # the command `mean` computes an average
```

```
[1] 69.57459
```
